Columbia; Shinozaki K., Davis R.W., Ecker J.R., Theologis A.; Shinozaki K., Davis R.W., Ecker J.R., Theologis A.; "RIKEN Arabidopsis full length cDNA clones (RAFLs) sequenced by t SSP consortium (Salk/Stanford/PGEC)."; SSP consortium (Salk/Stanford/PGEC)."; Submitted (CCT-2001) to the EMBL/GenBank/DDBJ databases. Submitted (CCT-2001) to THE S30E FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                              "An in situ hybridization screen for the rapid isolation of differentially expressed genes.";

Dev. Genes Evol. 210:28-33(2000).

-I- MISCELLANEOUS: THIS RIBOSOMAL PROTEIN IS SYNTHESIZED AS A C-TERMINAL EXTENSION PROTEIN (CEP) OF A UBIQUITIN-LIKE PROTEIN.

-I- SIMILARITY: BELONGS TO THE S30E FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                      Oryzias latipes (Medaka fish) (Japanese ricefish).

FRABILITY AND INHIBITS TRANSCRIPTION. IT ALSO BINDS TO SS-DNA AND RNA BUT WITH A WUCH LOWER AFFINITY. H-NS HAS POSSIBLE HISTONE-LIKE FUNCTION. MAX BE A GLOBAL TRANSCRIPTIONAL REGULANOR THROUGH ITS ABILITY TO BIND TO CUNFED DNA SEQUENCES, WHICH ARE FOUND IN REGIONS UPSTREAM OF A CERTAIN SUBSET OF PROMOTERS. IT PLAYS A ROLE IN THE THERMAL CONTROL OF PILI PRODUCTION. IT IS SUBJECT TO TRANSCRIPTIONAL AUTO-REPRESSION. IT BINDS PREFERRNIALLY TO THE UPSTREAM REGION OF ITS OWN GENE RECOGNIZING TWO SEGMENTS OF DNA ON BUTH. SIGNIANTS OF DNA ON BUTH. SIGNIANTS OF DNA ON BETTELLY TO THE UPSTREAM REGION OF ITS OWN GENE RECOGNIZING TWO SEGMENTS OF DNA ON BUTH.

-I'- FUNCTION: S11 PLAYS AN ESSENTIAL ROLE FOR THE SELECTION OF THE CORRECT TRNA IN PROTEIN BIOSYNTHESIS. IT IS LOCATED ON THE LARGE LOBE OF THE SMALL SUBDINIT (BY SIMILARITY).

-I'- SIMILARITY: BELONGS TO THE S11P FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

"Nucleotide sequence, regulation and functional analysis of the pape gene regulated for cell surface localization of Pap pili of uropathogenic Escherichia coli.";
Mol. Microbiol. 1:169-178(1987).
-!- FUNCTION: FTHBRIAR (ALSO CALLED PILI), POLAR FILAMENTS RADIATING FROM THE SURFACE OF THE BACTERIUM TO A LENGTH OF 0.5-1.5 MICROMETERS AND NUMBERING 100-300 PER CELL, ENABLE BACTERIA TO COLONIZE THE EPITHELLUM OF SPECIFIC HOST ORGANS.
-!- FUNCTION: PAPH SEEMS TO ANCHOR THE PILUS TO THE BACTERIAL CELL. IN ADDITION THE STOLGHLOMETRIC RELATIONSHIP BETWEEN PAPH AND PAPA DETERMINES THE PILUS LENGTH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE-93023852; PubMed-1357526; Marklund B.-I., Tennent J.M., Garcia E., Hamers A., Baga M., Lindberg F., Gaastra W., Normark S., "Horizontal gene transfer of the Escherichia coli pap and prs pill operons as a mechanism for the development of tissue-specific

"Characterization of a transforming, novel ras-related molecule.",

"Characterization of a transforming, novel ras-related molecule.",

"Submitted (OCT-1997) to the EMBL/GenBank/DBJ databases.

-i- FUNCTION: MAY SERVE AS AN IMPORTANT SIGNAL TRANSDUCER FOR A NO

UPSTREAM STIMULI IN CONTROLLING CELL PROLIFERATION. WEAKLY

ACTIVATES THE MAP KINASE PATHWAY (BY SIMILARITY).

-i- SIMILARITY: TO RAS PROTEINS. BELONGS TO THE R-RAS SUB-FAMILY.

1. FUNCTION: MAY SERVE AS AN IMPORTANT SIGNAL TRANSDUCER FOR A NUPSTREAM STIMULI IN CONTROLLING CELL PROLIFERATION. MEAKLY ACTIVATES THE MAP KINASE PATHWAY (BY SIMILARITY).

1. TISSUE SPECIFICITY: EXPRESSED IN SKELETAL MUSCLE CELLS.

1. SIMILARITY: TO RAS PROTEINS. BELONGS TO THE R-RAS SUB-FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota; Metazoa; Chordata;

THE ALPHA SUBUNIT CATALYZES THE DISMUTATION OF 6,7-DIMETHYL-8-LUMAZINE TO RIBOFLAVIN AND 5-AMINO-6-(1'-D)-RIBITYL-AMINO-2,4(1H,3H)-PYRIMIDINEDIONE (BY SIMILARITY).

CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine riboflavuh + 4-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.

PATHMAY: FINAL STEPS OF RIBOFLAVIN SYMTHESIS.

SUBUNIT: OLIGOMER THAT CONSIST OF 3 ALPHA SUBUNITS AND 60 BETA SUBUNITS (BY SIMILARITY).
